

Fiat Punto MK 2 Model year 1999–2003 Control lamps stay on

After switching off the ignition, the control lamps stay on

As already stated, it may be that in the case of these Punto models, one or more warning lamps stay switched on when switching off the ignition.

Information update:

The battery itself no longer needs to be disconnected from the entire vehicle electric system; the removal of fuse number 53 with the ignition switched off is sufficient.

In the case of the Punto MK 2 models, a body control module is fitted which sends signals to the instrument unit via the CAN bus. In the case of some models, it may be that these signals are sent all the time, so that the control lamps stay switched on. By removing the fuse, the power supply of the control module is interrupted and the module is re-initialized.
