

OPEL

Vectra C

With automatic air conditioning

No automatic mode

If with the above-mentioned vehicles customers should complain about the display being missing or the automatic mode of the air-conditioning system not working, please draw their attention to the following:

If the interior temperature is set to below 16 °C or above 28 °C, "Lo" or "High" is shown on the screen. This means that the air-conditioning system is being operated continually at max. cooling power or the heating at max. heating power. In both these cases, temperature regulation no longer takes place. Since the system is no longer in "automatic" mode, the control lamp in the "Auto" button is not lit neither is "Auto" shown on the display.

This is not a fault, however, rather the normal system behaviour.
