

## Opel Vectra C and Signum Model year 2004

### Starter not working

If there are complaints about the above-mentioned fault, the cause could be a defective fuse. A short-circuit between terminal 50 and the heat shield occurs due to an incorrectly fitted cable lug (twisted 180°). Fuse F 2 therefore blows. In this case proceed as follows:

- Turn off the ignition.
- Correct the position of the cable lug on the starter (Fig. 1).
- Replace fuse F 2 (25 amps). This fuse can be found on the front right-hand side of the engine compartment, under the plastic cover (Fig. 2).
