

Renault Megane I **With engine: 1.6 l (K7M) 1995–1999** **1.6 l 16V (K4M) 1999–2003**

Poor engine running, increased exhaust emissions.

If there are complaints with these vehicles that the engine is running poorly and that the exhaust emissions have increased, one possible cause is a poor earth connection. In the case of both engine types, the earth connection below the intake manifold is affected. Among other things, this earth point is the earth connection for the engine control unit. In order to eliminate the fault, the earth connection must be removed and cleaned.

Fault codes which may be stored in the engine control unit must be erased using suitable diagnosis equipment.
